

PALAMIX®

QUALITY AND FLEXIBILITY IN MIXING

HIGH CEMENT QUALITY AND SAFETY

PALAMIX®: FOR SUCCESSFUL SURGICAL OUTCOME

Using modern cementing technique in arthroplasty is key to ensure long survival rates for endoprostheses and a low risk of revision.^{1,2} One of its crucial success factors is a homogeneously mixed bone cement.³

Vacuum mixing improves cement homogeneity by reducing porosity and strengthens the cement prosthesis interface.⁴ The disposable vacuum mixing system PALAMIX® enables standardised mixing of homogeneous bone cement of reproducibly high quality.

VACUUM MIXING

- porosity of 0.1–1%⁵
- substantially decreases cement implant interface voids⁴
- increases force required to separate cement and implant and improves fatigue strength⁴
- reduces the longer term risk of revision in THA¹
- substantially reduces MMA* fumes (<10 ppm)^{6,7}

NON-VACUUM MIXING

- porosity of 5–16%⁵
- weaker cement implant bonds⁴
- decreases the fatigue life of the cement³
- higher MMA fumes exposure⁶

SAFETY FOR STAFF AND PATIENTS

To ensure a high level of safety, PALAMIX® has a filling funnel with two separate sections for the bone cement components. A particle filter in the liquid chamber protects against small glass particles in the bone cement. It avoids injuries and preserves the cement's mechanical quality.

Additionally, the PALAMIX® vacuum hose comes with an active charcoal filter that minimises MMA fumes during mixing.⁷

MORE CONVENIENCE AND FLEXIBILITY

MIXING AND COLLECTING

With PALAMIX®, the mixing of the components and the collection of the bone cement is carried out under vacuum, which

- facilitates mixing
- saves preparation time before application
- reduces porosity⁵
- results in a homogeneously mixed bone cement that builds the basis for long term success in arthroplasty.⁸

APPLYING AND PRESSURISING

PALAMIX® provides various options for application and pressurisation of bone cement. Different nozzles are available for individual procedures and allow flexibility in surgery. With PALAMIX®, it is even possible to expel the mixed bone cement remaining in the nozzle, thereby minimising cement waste. A spatula clip can be attached to the short nozzle to apply a thin cement layer on the bone or prosthesis.

Pressurisation results in greater penetration of the bone, improved bone cement interface and increased fatigue strength of the cement.⁹ The PALAMIX® system contains two pressurisers for both, hip and knee arthroplasty. The soft material and shape of the femoral pressuriser enhance the sealing of the femur during cement application.¹⁰

In knee surgery, the included knee pressuriser helps to increase the cement's interdigitation into the tibial plateau.¹⁰

PALAMIX®

ADVANTAGES AT A GLANCE

- homogeneous bone cement of reproducibly high quality
- convenient and intuitive handling
- time saving thanks to collection under vacuum
- various application options for flexibility in surgery
- safety for staff and patients

PALAMIX®	Description	Content	REF
PALAMIX® uno	Vacuum mixing system with collection under vacuum for up to two pouches (2x40)	10	66057893
PALAMIX® duo	Vacuum mixing system with collection under vacuum, with two cartridges for up to four pouches (4x40)	10	66057897
PALAMIX® medium nozzle	Flexible, conical nozzle; Ø 8.7–12.6 mm	10	66043960
PALAMIX® slim nozzle	For use with low-viscosity bone cements; Ø 7 mm	10	66036747
PALAMIX® cement gun	Reusable cement gun	1	66036163
PALAMIX® vacuum pump	Vacuum pump	1	66036748
